

Abstract of the Disclosure

A bracket for mounting and supporting a rain gutter that includes an overlying, leaf- and debris-shedding cover. The bracket is an L-shaped element that includes a first leg that lies against a gutter rear wall and is suitably secured to a fascia board, such as with screws. A second leg extends outwardly from the first leg and terminates in a hook-shaped end to receive and support the inturned front edge of the gutter. The second leg includes an opening for attaching the front edge of the cover in spaced relationship to the gutter front edge. One or more openings are provided in the bracket for receiving connecting screws for connecting a gutter end cap to a bracket positioned adjacent the gutter end.
